

Bio-based Dyneema® fibre

Green

A carbon footprint that is 90% lower than generic HMPE

As strong as ever

Boasts the exact same characteristics, specifications, and performance as conventional Dyneema®

Certified

Entire process is certified for compliance according to the International Sustainability and Carbon Certification (ISCC)

Going even greener: Gleistein's complete switch to bio-based Dyneema®

To ensure the implementation of the highest standards for resource-conscious and ethically responsible production and use of its products, Gleistein has become the world's first major rope manufacturer to switch its entire portfolio of products made with Dyneema® to be manufactured exclusively from bio-based Dyneema® fibres. We are also committed to donating a percentage of all revenue generated with bio-based Dyneema® to non-profit organisations that are dedicated to protecting the environment.

Gleistein has a solid history in taking an active approach to promoting sustainability and environmental protection. Its conversion to green electricity and the establishment of our own combined heat and power plant in 2013, recognition as being the first "Climate Protection Company CO₂-20" by the state government of Bremen in 2015, waste avoidance through outstanding product longevity, on-site vehicle charging stations to promote e-mobility as well as the settlement of bee colonies on the company premises are clear testimony of this, as is now being the world's first major rope manufacturer to completely switch to bio-based Dyneema®.

What is bio-based Dyneema® fibre?

Bio-based Dyneema® is the first ever bio-based HMPE fibre. To enable this, it utilises the so-called mass balance approach and further reduces reliance on fossil fuel-based resources, thereby helping to cut carbon emissions without any compromise to quality whatsoever.

What is the bio-based Dyneema® "mass balance approach"?

The mass balance approach is designed to trace the flow of bio-based and fossil feedstocks used in the complex production value chain. It entails ensuring the share of bio-based feedstock used in the production process is accurately and separately registered. In this way, the exact portion of the final product made with the bio-based fibre component can be accurately identified and allocated at the end of the production process – and is certified by the ISCC. The mass balance approach is commonplace and has been successfully implemented for many years, such as in the supply of green gas and electricity.
